Fazle Rabbi et al. (HiB, UiO)

A generalization of termination conditions

# Example: Application of a completion rule that deletes elements

Fazle Rabbi et al. (HiB, UiO)

A generalization of termination conditions

- Based on the principles adapted from layered graph grammars [Ehrig, 2006].
- Completion rules are distributed across different layers.
- Rules of a layer are applied as long as possible before going to the next layer.
- We generalize the layer conditions from [Ehrig, 2006] allowing deleting and non-deleting rules to reside in the same layer as long as the rules are loop-free.

- Rules of a layer are applied as long as possible before going to the next layer.
- We generalize the layer conditions from [Ehrig, 2006] allowing deleting and non-deleting rules to reside in the same layer as long as the rules are loop-free.

Our generalized layered approach is based on a necessary condition ( $C1 \lor C2 \lor C3$ ) for looping, where:

- C1: A rule r<sub>i</sub> that creates an element x of type t does not have a NAC that forbids the
  existence of element of type t.
- C2: If a rule r<sub>i</sub> creates an element x of type t and has a NAC that forbids the existence of element of type t, then there exists a rule r<sub>i</sub> that deletes an element of type t.
- C3: If a rule *r<sub>i</sub>* deletes an element *x* of type *t*, then there exists a rule *r<sub>j</sub>* that creates an element of type *t*.

*Proof:* Let  $G_0 = S_i$  be an initial graph typed by  $S_{i-1}$  where  $S_i, S_{i-1}$  are finite graphs. Let  $R_k$  be a finite set of rules at layer k. A rule  $r \in R_k$  can either

- creates an element x of type t, where
  - a *r* does not have a *NAC* that forbids the existence of element of type *t*. or
  - b *r* has a NAC that forbids the existence of element of type *t*. and/or
- 2 deletes an element x' of type t'

< ロ > < 同 > < 回 > < 回 >

Proof: A rule  $r \in R_k$  can either

- creates an element x of type t, where
  - a r does not have a NAC that forbids the existence of element of type t. or
  - b r has a NAC that forbids the existence of element of type t.

and/or

deletes an element x' of type t'

Consider case 1.(a):

The rule r has finite number of injective matches  $c_r = \{(\delta, m) \mid (\delta, m) \text{ is a match for } G_0 \triangleright S_{i-1}\}$ . For each injective match of  $L \rightarrow G_0$ , application of r creates an element x of type t. The rule can be applied indefinitely in a loop during the derivation process of layer k since the application of rule r does not decreases the number of matches. Therefore C1 is a necessary condition for looping.

< 日 > < 同 > < 回 > < 回 > < □ > <

### Proof:

A rule  $r \in R_k$  can either

- creates an element x of type t, where
  - a r does not have a NAC that forbids the existence of element of type t. or
  - b r has a NAC that forbids the existence of element of type t.

and/or

deletes an element x' of type t'

Consider case 1.(b):

```
The rule r has finite number of injective matches c_r = \{(\delta, m) \mid (\delta, m) \text{ is a match for } \}
G_0 \triangleright S_{i-1} and (\delta, m) \models NAC. For each injective match of L \rightarrow G_0, application of r creates an
```

element x of type t.

Therefore, the application of rule r decreases the number of matches.

In order to apply r indefinitely in a loop during the derivation process of layer k, elements of type t must be deleted.

Therefore C2 is a necessary condition for looping.

Proof: A rule  $r \in R_k$  can either

- creates an element x of type t, where
  - a r does not have a NAC that forbids the existence of element of type t. or
  - b r has a NAC that forbids the existence of element of type t.

and/or

deletes an element x' of type t'

Consider the first case 2:

The rule r has finite number of injective matches  $c_r = \{(\delta, m) \mid (\delta, m) \text{ is a match for } \}$ 

 $G_0 \triangleright S_{i-1}$  and  $(\delta, m) \models NAC$ .

In order to apply r indefinitely in a loop during the derivation process, new elements of type t' must be created.

Therefore C3 is a necessary condition for looping.

イロト 不得 トイヨト イヨト

**Corollary 1.** A sufficient condition for loop-free rules in layer k is the negation of  $(C1 \lor C2 \lor C3)$ 

**Corollary 1.** A sufficient condition for loop-free rules in layer k is the negation of  $(C1 \lor C2 \lor C3)$ 

**Corollary 1.** A sufficient condition for loop-free rules in layer k is the negation of  $(C1 \lor C2 \lor C3)$ 

We propose a loop detection algorithm that is based on the following sufficient conditions for loop freeness. Let  $R_k$  be the set of rules of a layer k.

- If a rule  $r_i \in R_k$  creates an element x of type t, then  $r_i$  must have an element of type t in its NAC,
- If a rule  $r_i \in R_k$  creates an element x of type t, then there is no rule in  $r_j \in R_k$  that deletes an element of type t,
- If a rule  $r_i \in R_k$  deletes an element of type t, then there is no rule in  $r_j \in R_k$  that creates an element of type t

## Generalized layered approach

Fazle Rabbi et al. (HiB, UiO)

A generalization of termination conditions

We propose a loop detection algorithm that is based on the following sufficient conditions for loop freeness. Let  $R_k$  be the set of rules of a layer k.

- If a rule  $r_i \in R_k$  creates an element x of type t, then  $r_i$  must have an element of type t in its NAC,
- If a rule  $r_i \in R_k$  creates an element x of type t, then there is no rule in  $r_j \in R_k$  that deletes an element of type t,
- If a rule  $r_i \in R_k$  deletes an element of type t, then there is no rule in  $r_j \in R_k$  that creates an element of type t

Figure : These rules may produce a non-terminating situation if they are executed in the same layer

- If a rule r<sub>i</sub> ∈ R<sub>k</sub> creates an element x of type t, then r<sub>i</sub> must have an element of type t in its NAC,
- If a rule  $r_i \in R_k$  creates an element x of type t, then there is no rule in  $r_j \in R_k$  that deletes an element of type t,
- If a rule  $r_i \in R_k$  deletes an element of type t, then there is no rule in  $r_j \in R_k$  that creates an element of type t

Fazle Rabbi et al. (HiB, UiO)

A generalization of termination conditions

- If a rule r<sub>i</sub> ∈ R<sub>k</sub> creates an element x of type t, then r<sub>i</sub> must have an element of type t in its NAC,
- If a rule  $r_i \in R_k$  creates an element x of type t, then there is no rule in  $r_j \in R_k$  that deletes an element of type t,
- If a rule  $r_i \in R_k$  deletes an element of type t, then there is no rule in  $r_j \in R_k$  that creates an element of type t

- If a rule r<sub>i</sub> ∈ R<sub>k</sub> creates an element x of type t, then r<sub>i</sub> must have an element of type t in its NAC,
- If a rule  $r_i \in R_k$  creates an element x of type t, then there is no rule in  $r_j \in R_k$  that deletes an element of type t,
- If a rule  $r_i \in R_k$  deletes an element of type t, then there is no rule in  $r_j \in R_k$  that creates an element of type t

- If a rule r<sub>i</sub> ∈ R<sub>k</sub> creates an element x of type t, then r<sub>i</sub> must have an element of type t in its NAC,
- If a rule  $r_i \in R_k$  creates an element x of type t, then there is no rule in  $r_j \in R_k$  that deletes an element of type t,
- If a rule  $r_i \in R_k$  deletes an element of type t, then there is no rule in  $r_j \in R_k$  that creates an element of type t

**Theorem 1.** (termination of loop-free rules). An empty table obtained by loop free rule detection analysis for a set of rules E implies that the execution of E will terminate for any finite size initial graph.

# Conclusion and Future work

## Summary

- Completion rules are defined as coupled graph transformation rules
- Completion rules are reusable
- Generalized termination analysis is based on layered approach
- We have Implemented a proof-of-concept of the proposed approach

## **Future Work**

- Improve performance of the transformation system
- Automatically construct completion rules by processing constraints
- Develop concrete graphical syntax
- Support collaborative development
